

PROPOSAL FOR TECHNOLOGY PARTNERS

Strategic Partnership Proposal

UNIHUM is seeking a technology partner to develop an intelligent platform that combines a methodology for the evolution of human consciousness with the capabilities of modern artificial intelligence.

At the core of the platform could be a **personalized conversational AI model with reflective analysis capabilities**. Its purpose would be to help individuals better understand their own values, motivations, internal contradictions, and the consequences of their decisions, while supporting the development of an individual pathway for personal growth.

At the societal level, the platform could identify different value- and meaning-oriented patterns of consciousness and develop corresponding educational and developmental programs — **without ranking human worth or imposing a single ideology**.

UNIHUM Provides:

- a methodology for the evolution of consciousness;
- a system of twelve interconnected Principles;
- the conceptual architecture of the platform;
- a body of foundational materials;
- conceptual and methodological guidance throughout the development process.

We Are Looking for a Technology Partner Who Can Provide:

- advanced artificial intelligence models;
- research and engineering infrastructure;
- expertise in conversational and personalized AI systems;
- resources for developing a pilot version;
- capabilities for subsequent scaling.

The first stage of collaboration could involve establishing a joint working group and developing a prototype conversational model to test the methodology in practice.

UNIHUM is not proposing another educational product. It is proposing a new direction for the application of AI — using artificial intelligence to support the development of human maturity, responsibility, and inner coherence.
